

SPRAY JET

As the name suggests, the aim of this fountain nozzle is to generate a large volume of water spray or mist. The aim is not to create great heights but rather large volumes, making it particularly suitable for architectural fountains lit up at night by our underwater spotlights. It should not be installed in open places and, in any case, only at a low height combined with other higher patterns.

- Water appearance
- Wind resistance
- Splash
- Sound level
- Visibility
- Mist
